                                 The invention relates to a protein tyrosine kinase substrate LAT (linker for activation of T cells) protein. Modulation of interaction between LAT and the T-cell receptor (TCN) affects the TCR signalling pathway. LAT is a substrate for tyrosine Kinases and becomes phosphorylated after TCR engagement, resulting in recruitment of other signalling molecules. LAT is used to identify and test (ant)agonists of tyrosine Kinase signalling pathways, i.e. modulation of interaction between tyrosine kinase substrates and intracellular ligands or between these ligands and other members of the pathway including identification of downstream signalling proteins, particularly in immune system cells. These modulators are potentially useful as drugs and diagnostic agents, particularly in immune system cells. These modulators are potentially useful as drugs and diagnostic agents, particularly for diseases that involve undesirable cell proliferation, differentiation, growth or T cell anergy, e.g. neoplasia, inflammation, differentiation, and is assess, and inflammation metabolic, genetic a proliments, are used to identify homologous sequences in other species; to detect the potentially more specific and less toxic than known immunosuppressants sources of antisense therapeutics. Modulators of LAT are potentially more specific and less toxic than known immunosuppressants
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1070 gttactgotgatgggaacattctccagacaatccctcacaataaacctctctccaagca 1129

The invention relates to subunits cellulose synthetic equipment, that can be used to increase the amount cenlulose synthesised by a plant. The proteins and genes encoding them can also be used to improve the properties of the cellulose being produced by a plant.
                                                                                                                       1143

The specification describes antisense oligonucleotides (X52869-X55271)

directed against at least 2 mRNAs selected from target genes, coding and
non-coding regions of RNAs corresponding to target genes, gene
non-coding regions of RNAs corresponding to target genes, gene
continitation codoss, genomic flanking regions, intron-exon borders, the
continitation codoss, genomic flanking regions, intron-exon borders, the
continitation codoss, genomic flanking regions between coding and non-coding
regions and all segments of RNAs encoding proteins associated with one
correct diseases, conditions or mixtures. The antisense oligonucleotides
may be derived from sequences X55180-271, can be used for the antisense
configuration of diseases and conditions. Typical diseases and conditions
are those associated with impaired respiration and inflammation,
concluding lung diseases, pulmonary vasoconstriction, inflammation,
concluding lung diseases, pulmonary vasoconstriction, emphysema, chronic obstructive
concluding vasociated variations and cancers, pulmonary
concern, hepatocallular carcinome, kidney cancer, lung cancer, pancreatic
concern, hepatocallular carcinome, kidney cancer, ung cancer, pancreatic
concern, hepatocallular carcinome, withous cancer, melanome, hepatic
concernsion, as well as all types of centers will and cancers and concerns and conc

chambutol (EMB). It includes the embA, embC and embb genes that encode proteins, (see W7302-54) which are the target of action of M. smegmatis for EMB. To identify genes conferring EMB resistance, a genomic library from a high level EMB-resistant mutant of M. smegmatis as introduced into wild-type M. smegmatis mo2155. Four overlapping cospids were identified which conferred a resistant phenotype. The minimum size fragment capable of conferring EMB resistance was 9 kb (pIMM99). pIMM99 plus 7 kb upstream M. smegmatis sequence was dequences revelating 3 homologous open reading frames (embC, embB, embB) and 4 additional potential coding regions. Wild-type and mutated embCAB nucleic acid sequences are useful as probes used in the diagnosis of furqu-resistant mycobacteria infections; anti-DNA or anti-RNA sequences can be invention additionally provides for the use of embCAM operon conficience acid sequences as vaccines, or to improve existing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ggccatcggctatgtgagctcagatggcagcatcctgcagaccatccctgccaacaaacc 890

directed against at least 2 mRNAs selected from target genes, coding and non-coding regions of RNAs corresponding to target genes, coding and non-coding regions of RNAs corresponding to target genes, coding and coding regions, intron-exon borders, the initiation codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'-end and the juxta-section between coding and non-coding regions and all segments of RNAs encoding proteins associated with one or more diseases, conditions or mixtures. The antisense oligonucleotides (specifically X55180-271) can be used for the antisense coligonucleotides (specifically X55180-271) can be used for the antisense treatment of diseases and conditions. Typical diseases and conditions are those associated with impaired respiration and inflammation, including lung diseases, pulmonary vasoconstriction, inflammation, allergic rhinitis, acute asthma, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, pulmonary hypertension, pulmonary vasoconstriction, emphysema, chronic obstructive pulmonary disease (COPD), and cancers such as leakenias, lymphomas, carcinomas e.g. colon cancer, breast cancer, melanoma, hepatic metastasses, as well as all types of cancers, melanoma, hepatic metastasized to the lungs, including breast and prostate cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                DE 105055 GCGGCGCGCCCCVGGCCNHNNNNSCGGCCGGCGCGCGCGCGCGCCCVGGCCVNHNNNNSCG 104996

The cosmid contains open reading frames which encode the various modules of the narbonolide polyketide synthase (FKS). The invention relates to recombinant DNA containing a coding sequence for a narbonolide PKS. Polyketides are compounds synthesised from 2-carbon units through a series of condensations and subsequent modifications. Modular PKSs are responsible for the production of many antibiotics including picromycin. The narbonolide PKS consists of a loading module, six extender modules,

```
and two thioester domains. Four proteins make up the narbonolide PKS (PICAI, PICAII and PICAIV). PICAI includes the loading module and extender modules 1 and 2, PICAII includes extender module 3 and 4, PICAIII includes extender module 5 and PICAIV includes extender module 6 and a type II thioesterase domain. The second type II thioesterase domain. The second type II thioesterase domain is found on the PICA protein. The nucleotide sequences encoding all of these proteins can be isolated in recombinant form from the recombinant cosmid pKOSO13-27. Narbonolide is desosaminylated in S. venezuelae to yield narbonovicin, the desosaminyl transferase enzyme is required for this conversion, and the desosaminyl transferase enzyme is required for this conversion, and the desosamine biosynthetic genes are also found in cosmid pKOSO13-27. The recombinant DNA of the invention is used to express, in transformed cells, narbonolide (or its derivatives) or other ketolides (particularly hybrids), which may then be converted (e.g. by other enzymes recombinantly expressed in the same hosts) to polyketide antibiotics or their intermediates. The antibiotics are useful in human contractions.

The invention relates to an isolated and purified nucleic acid segment comprising a desosamine biosynthetic gene cluster, a fragment or its biologically active variant, where the nucleic acid sequence is not derived from the eryC gene cluster of saccharopolyspora erythraea or Streptomyces antibioticus. The invention also relates to a macrolide biosynthetic gene cluster encodes proteins which synthesise methymycin, pixromycin, neonethymycin, narbomycin or a combination of these compounds. Recombinant or augmented cells compourising the desosamine and/or macrolide biosynthetic gene clusters are useful for the production of biologically active macrolides. The macrolide biosynthetic proteins are useful for synthesis of methymycin, pixromycin, neonethymycin and narbomycin. The alternative termination of polyketide synthesis may be useful to prepare novel antibiotics and polykdroxyalkanoate (PHA) monomers. The compounds produced by the recombinant host cells are useful so biopolymers, e.g., in packaging or biomedical applications, to engineer PHA monomer synthases or to prepare biologically active agents, such as chemotherapeutics, immunosuppressants, agents to treat asthma, chronic obstructive pulmonary disease as well as other diseases involving respiratory inflammation, cholesterol-lowering agents or macrolide-based antibiotics which are active against a variety of organisms, e.g., hardrais and antibiotics are active against a variety of organisms, e.g., hardrais and antibiotics are active against a variety of organisms, e.g., hardrais and all and a variety of organisms, e.g., hardrais and all and a variety of organisms, e.g., hardrais and antibiotics and adainst a variety of organisms, e.g., hardrais and antibiotics and adainst a variety of organisms, e.g., hardrais and a companisms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     0;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                bacteria, including multi-dug resistant pneumococci and other respiratory pathogens, as well as viral parasitic pathogens, or as crop protection agents (e.g., fungicides or insecticides) via expression of polyketides in plants. Sequences 287286-287294 represent desosamine biosynthetic genes from Streptomyces venezuelae ATCC 15439, which encode proteins Y77181-Y77189.
                                                                                                                                                                                    Desosamine and macrolide biosynthetic gene clusters, useful for, e .g. synthesis of methymycin and pikromycin -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1125 CCGCTCGGCCCATTCGCGCACGGCGTCGATCACCCGCAGCGCCTGCGGGCGCTCCAGGTG 1066

New recombinant DNA encoding a domain of narbonolide polyketide synthase, for production of ketolide antibiotics -

Disclosure; Page 37-38; 98pp; English.

This is contig 003 from the recombinant cosmid pk05023-27 DNA sequence (see 256001) which contains a Streptomyces venezuelae DNA insert. The cosmid contains open reading frames which encode the various modules of the narbonolide polyketide synthase (PKS). The invention relates to the narbonolide polyketide synthase (PKS). The invention relates to combinant DNA containing a coding sequence for anarbonolide PKS.

CC recombinant DNA containing a coding sequence for anarbonolide PKS.

CC responsible for the production of many antibiotics including picromycin consists of a loading module, six extender modules, and two thioseter domains. Four proteins make up the narbonolide PKS and two thioseter domains. Four proteins make up the narbonolide PKS and extender modules a land 2, PICAII includes the loading module of and atype II thioseterase domain. The second type II thioseterase domain. The second type II thioseterase domain. The second type II thioseterase domain consideration on the PICB protein. The nucleotide sequences encoding all of these proteins can be isolated in recombinant form from the accombinant commit pkOSO23-27. Narbonolide is desosaminalized in S. venezuelae to commid pkOSO23-27. The desosamine biosynthetic genes are also found in commid pkOSO23-27. The recombinant plosynthetic genes are also found in commid pkOSO23-27. The recombinant how then be converted (e.g. by cher enzymes recombinantly expressed in the same hosts) to polyketide artibiolics or their intermediates. The antibiotics are useful in human articles and a their intermediates. The antibiotics are useful in human and a second and or veterinary medicine

synthesis of methymycin and pikromycin

The invention relates to an isolated and purified nucleic acid segment comprising a desosamine biosynthetic gene cluster, a fragment or its biologically active variant, where the nucleic acid sequence is not derived from the eryc gene cluster in Saccharopolyspora erythraea or Streptomyces antibioticus. The invention also relates to a macrolide biosynthetic gene cluster, or fragments thereof. The macrolide biosynthetic gene cluster encodes proteins which synthesise methymycin,

ρ. . Desosamine and macrolide biosynthetic gene clusters, useful for,

Claim 2; Page 281-287; 438pp; English.

Fri

```
The invention relates to an isolated and purified nucleic acid segment comprising a desosamine biosynthetic gene cluster, a fragment or its biologically active variant, where the nucleic acid sequence is not derived from the eryC gene cluster of Saccharopolyspora erythraea.or streptomyces antibloticus. The invention also relates to a macrolide biosynthetic gene cluster. Or fragments thereof. The macrolide biosynthetic gene cluster encodes proteins which synthesise methymycin, pixromycin, neomethymycin, narbomycin or a combination of these compounds. Recombinant or augmented cells comprising the desosamine and conform macrolide biosynthetic gene clusters are useful for the production of biologically active macrolides. The macrolide biosynthetic proteins are useful for synthesis of methymycin, pixromycin, neomethymycin and narbomycin. The alternative termination of polyketide synthesis may be useful to prepare novel antibiotics and polykydroxyalkanoate (PHA) monomers. The compounds produced by the recombinant host cells are useful as blopolymers, e.g., in packaging or biomedical applications, to
                                                                                                                                                                                                                                                                                                                                                       ./product= "PixB gene cluster protein #6 (Y77208)"

pikromycin, neomethymycin, narbomycin or a combination of these compounds. Recombinant or augmented cells comprising the descamine and/or marcolide biosynthetic gene clusters are useful for the production of biologically active macrolides. The macrolide biosynthetic proteins are useful for synthesis of methymycin, pikromycin, neomethymycin and narbomycin. The alternative termination of polyketide synthesis may be useful to prepare novel antiblodics and polyhydroxyalkanoate (PHA) as biopolymers. The compounds produced by the recombinant host cells are useful as biopolymers, e.g., in packaging or biomedical applications, to engineer PHA monomer synthases or to prepare biologically active agents such as chemotherapeutics, immunosuppressants, agents to treat asthma, chronic obstructive pulmonary disease as well as other diseases involving respiratory inflammation, cholesterol-lowering agents or macrolide based and antiblotics which are active against a variety of organisms, e.g., p. 100.
                                                                                                                                                                                                                                                                                                                                   bacteria, including multi-drug resistant pneumococi and other respiratory pathogens, as well as viral parasitic pathogens, or as crop protection agents (e.g., fungicides or insecticides) via expression of polyketides in plants. The present sequence represents the desosamine biosynthetic gene cluster from Streptomyces venezuelae ATCC 15439.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Desosamine biosynthesis; macrolide; polyketide; methymycin; pikromycin; neomethymycin; narbomycin; polyhydroxyalkanoate monomer synthase; biopolymer; antibiotic; chemotherapeutic; immunosuppressant; asthma, chronic obstructive pulmonary disease; respiratory inflammation; hypercholesterolaemia; crop protection agent; ds.

engineer PHA monomer synthases or to prepare biologically active agents, such as chamotherapeutics, immunosuppresants, agents to treat asthma, chronic obstructive pulmonary disease as well as other diseases involving respiratory inflammation, cholesterol-lowering agents or macrolide-based bacteria, including multi-drug resistant pneumococci and other respiratory pathogens, as well as viral parasitic pathogens, or as crop protection agents (e.g., fungicides or insecticides) via expression of polyketides in plants. The present sequence represents the desosamine biosynthetic gene cluster (pik) from Streptomyces venezuelae ATCC 15439, as given in figure 32.

New FADD (Fas-associated protein with a novel death domain)-Interacting Protein - useful for inducing or preventing apoptosis in a cell, to aid in controlling apoptosis-related diseases

Disclosure; Page 45-46; 58pp; English.

An epitope of human FADD (Fas-associated protein with a novel death domain)-Interacting protein (FIP protein) comprising amino acids 348-727 of the protein described in W96153, can be used to induce or prevent apoptosis in a cell. Specifically, decreasing the levels of FIP348-727 prevents apoptosis. This is useful in cells which are dying prematurely, eg: Alzheimer's disease, Acquired immune Deficiency Syndrome (AIDS), muscular dystrophy, amyotrophic alteral sclerosis (and other muscle wasting diseases) autoimmune diseases, and diseases where cells are infected with a pathogen (virus, bacteria, fungus, myopulasm or protozoa). Increasing the levels of FIP 348-727 induces apoptosis which is useful in cells suffering from meoplasias, dysplasias, hyperplasias, or their symptoms. Purified and isolated FIP subgenomic polymucleotides are useful as primers to obtain more copies of the nucleotides, and as probes that identify wild-type or mutant coding sequences. They are also useful for expressing FIP man, proteins or fusion proteins, and in the generation of FIP manisense cligonucleotides and in the generation of FIP manisense cligonucleotides and in the generation of FIP manisense cligonucleotides and an electron of FIP mans and in constructs and in gene delivery vehicles (optionally in combination with a condensing agent) that deliver FIP mRNA or oligonucleotides, FIP proteins antibodies into eukaryotic cells. This is the human FADD protein gene. Human FIP protein lin W96154.

```
The sequence encodes FADD (Fas-associating protein with novel death domain), which binds the cytoplasmic region of a Fas receptor, and modulates apoptosis induced by activation of the receptor by ligand binding. The CDNA has been isolated using a yeast two-hybrid system which screens for proteins interacting with the Fas cytoplasmic sytoplasmic domain. A GALA DNA-Dhading domain has been fused to the human Fas antigen cytoplasmic tail to form a bait plasmid, which is used with a prey plasmid, containing a human B-lymphocyte cDNA library fused to cover lapping clones 8 and 15 have been isolated, and the full-length cDNA has been isolated from a human umbilical vein endothelial cell in-frame stop codon 130 by upstream of the initiator Met. The cONA domain of Fas. The DNA may be used in gene therapy, and the protein or a corresponding antibody may be used to screen for apoptosis, for use in therapy of e.g. AIDS, inflammation,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             FADD protein that binds to cytoplasmic region of Fas receptor identifying inhibitors of Fas-associated apoptosis useful for treating e.g. AIDS, leukaemia, stroke, etc
                                                                                                                                                                                                                                                                                                                           *tag= g

The protein is involved in eliciting an intracellular signal in the human hedgehog-patched (HH-PTC). The protein, its antibodies and pharmaceutical compositions comprising them can be used as medicaments. The presence of a fused gene, DNA, mRNA, protein or subsequences of these in a biological sample are useful, e.g. as a marker to assess in vivo and/or in situ RNA transcription and/or translation, in cancer diagnostics, in prophylaxis, etc. The polymucleotide sequence can also be used to derive probes for the

detection and quantification of normal or abnormal fused gene sequences. The labeled probes can also be useful in karctyping analysis as markers of the fused gene. The polynucleotides may also be used in gene therapy methods. The polypeptide is useful as a lead compound in the design of analogues and mimics, as well as for screening for agonists and antagonists. The products may also be used for the study of different conditions, such as cancer and development of cancer therapies, the regulation of gene transcription, embryonic repair and tissue repair/wound healing, neurodegenerative diseases, and testicular
                                                                                                                                                                                                                                                                    function.

```
The present sequence encodes a human G-protein coupled receptor, designated Fishboy Fishboy products can be used to treat subjects in need of modulated Fishboy expression or activity. Diseases or disorders to be treated include bacterial, protozoal, fungal and viral, particularly HIV-1 or HIV-2 infections, pain, cancers, diabetes, obesity, anorexia, bulimia, asthma, Parkinson's disease, acute heart failure, apportension, hypertension, uninary retention, osteoporosis, angina pectoris, myocardial infarction, stroke, ulcars, allergies, benden prostatic hypertrophy, migraine, vomiting, psychotic and neurological disorders and dyskinesias such as Huntington's disease or Tourette's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             B2-bradykinin receptor gene exon 3 polymorphic region, allele BE3-R48
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    636

```

```
The present sequence represents allele BE3-R48 of the tandem-repeat polymorphic region of exon 3 of the B2-bradykinin receptor gene.
Two alleles have been identified; allele BE3-48R contains 48 tandem copies of repeat units with the consensus sequence rGGA(A)GGCTAGAACC, while allele BE3-35R contains 35 copies.
TGGA(A)GGCTAGAACC, while allele BE3-35R contains 35 copies.
The polymorphic sequences are useful for diagnosis (i.e. relating frequency of a potymorphism to disease occurrence) and/or treatment of myocardial infarction; coronary heart disease; sterility; hypertension; genetically related vascular disease; sterility; and acute or chronic inflammation. They can also be used to test potential drugs against such diseases and pharmaceuticals that contain and bradykinin (ant)agonists.
hypertension; genetically related vascular disease; sterility; infertility; atopia; asthma; allergy; altered bronchial reactivity; acute; chronic; inflammation; ss.

/note="Vector: pT7T3D-Pac (Pharmacia) with a modified polylinker; 1st strand CDNA was prepared from mammary palnd tissue from a lactating femele, and was then primed with a Not I - Oilgo(dT) primer. Double-stranded cDNA was ligated to Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of the modified pT7T3 vector. Library is normalized. Library was constructed by Bento Scares and M. Fatima Bonaldo."

/note="Organ: lung; Vector: pT7T3D-Pac (Pharmacia) with a modified polylinker; Plasmid DNA from the normalized library NoT_CGAP_Lus was prepared, and ss circles were made in vitro. Following HAP purification, this DNA was used as tracer in a subtractive hybridiatation reaction. The driver was PCR-amplified cDNAs from a pool of 5,000 clones made from the same library (cloneIDs 1414920-1417991 and 1520904-1522439). Subtraction by Bento Soares and M. Fetima Bonaldo. "84 t

WARWING: There is evidence that suggests that the 384-well parent
plate of this cone contains both human and mouse derived clones.
Thus, the origin of this clone is uncertain. This caution should be
kept in mind should you use this clone.

D-Cbl, the Drosophila homologue of the c-Cbl proto-oncogene,
interacts with the Drosophila EGF receptor in vivo, despite lacking
C-terminal adaptor binding sites
0ncogene 14 (22), 2709-2719 (1997) (1402 1522 1047 1107 1164 1102 1162 1222 1282 807 867 927 987 982 cbl gene; proto-oncogene.

murine retrovirus that induces pre-B and pro-B cell lymphomas. It was generated from the ecotropic Cas-Br-M virus by sequential recombinations with endogenous retroviral sequences and a cellular onocogene. The position of the oncogene junction was determined to be in the gag gene for pl0 at a position that removed the terminal 24 gag-encoded amino acids. The gag-onc duston protein appears to be responsible for fibroblast and pre-B cell transformation. The authors call this oncogene v-cbl for Casitas B-lineage lymphoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            13572
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       99471
Center project Information
Center project name: DRCJ
Center Clone name: RPC198-315
Center Clone name: RPC198-315
Center Clone name: RPC198-315
Chemistry: Dye-terminator Big Dye: 100% of reads
Assembly program: Phrap; version 0.980611
Consensus quality: 6210% bases at least Q40
Consensus quality: 95829 bases at least Q30
Consensus quality: 95829 bases at least Q20
Estimated insert size: 100104; sum-of-contigs estimation
Quality coverage: 1.1x in Q20 bases; sum-of-contigs estimation
                                                                                                                                                                                                                                                             NOTE: This is a 'working draft' sequence. It currently consists of 75 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                op in
